Kyla Pohl Partitions and Hook Walk Algorithms

- I am a 6th year mathematics PhD student at the University of Oregon.
- The math that I do is called "combinatorics."
- I'm currently applying for jobs as a postdoc or a math professor.

Definition

An *partition* of a positive integer n is a way to write n as a sum of other positive integers listed from biggest to smallest.

イロト イヨト イヨト イヨト

Definition

An *partition* of a positive integer n is a way to write n as a sum of other positive integers listed from biggest to smallest.

Example

One partition of 7 is 4 + 2 + 1.

Example

Here is a list of all the partitions of 4.

4 3+1 2+2 2+1+1 1+1+1+1

Kyla Pohl Partitions and Hook Walk Algorithms

・ロト ・回 ト ・ ヨト ・ ヨト …

We label partitions with Greek letters. We can also avoid writing the plus sign and just list all the parts inside parentheses. So for example, we could write 4 = 3 + 1 as $\lambda = (3, 1)$.

▲御▶ ▲臣▶ ▲臣▶

We label partitions with Greek letters. We can also avoid writing the plus sign and just list all the parts inside parentheses. So for example, we could write 4 = 3 + 1 as $\lambda = (3, 1)$.

Definition

The size of λ is the sum of all of its parts.

```
The size of \lambda = (3, 1) is 4 since 3 + 1 = 4.
```

・ ロ ト ・ 一 戸 ト ・ 日 ト

Let's draw pictures of partitions. For each part of a partitions λ , draw that many boxes in a row, left justified. We'll add a new row to our picture for each part.

Example

Let $\lambda = (4, 2, 1)$. When we draw a picture of λ as described above, we get the following.

Example

Let's draw the Young diagrams for all partitions of 4.

ヘロア 人間 アメヨア 人口 ア

Example

Let's draw the Young diagrams for all partitions of 4.

$$\lambda = (4)$$

ヘロア 人間 アメヨア 人口 ア

Example

Let's draw the Young diagrams for all partitions of 4.

$$\lambda = (4) \qquad \mu = (3,1)$$

ヘロア 人間 アメヨア 人口 ア

Example

Let's draw the Young diagrams for all partitions of 4.

$$\lambda = (4) \qquad \mu = (3,1) \qquad \nu = (2,2)$$

Kyla Pohl Partitions and Hook Walk Algorithms

ヘロア 人間 アメヨア 人口 ア

Example

Let's draw the Young diagrams for all partitions of 4.

$$\lambda = (4) \qquad \mu = (3,1) \qquad \nu = (2,2)$$

$$\sigma = (2, 1, 1)$$

Kyla Pohl Partitions and Hook Walk Algorithms

ヘロア 人間 アメヨア 人口 ア

Э

Example

Let's draw the Young diagrams for all partitions of 4.

 $\sigma = (2, 1, 1)$ $\beta = (1, 1, 1, 1)$

New Diagrams from Old

If I give you a Young diagram λ and one extra square, you can build a new diagram by placing the new square in one of the *outside corners* of λ .

outside corners of λ

New Diagrams from Old

・ロト ・回 ト ・ ヨト ・ ヨト …

So what would happen if we started with the partition (1)

э

So what would happen if we started with the partition $\left(1\right)$ and then added a square

ヘロト 人間 とくほ とくほ とう

э

So what would happen if we started with the partition (1) and then added a square and added another square

So what would happen if we started with the partition (1) and then added a square and added another square and then another

So what would happen if we started with the partition (1) and then added a square and added another square and then another and so on?

So what would happen if we started with the partition (1) and then added a square and added another square and then another and so on?

So what would happen if we started with the partition (1) and then added a square and added another square and then another and so on?

We'll end up with a new partition that's as big as we like.

ヘロト ヘヨト ヘヨト

So far, we've allowed ourselves to put our new box in any outside corner that we choose.

ヘロト 人間 とくほ とくほ とう

э

So far, we've allowed ourselves to put our new box in any outside corner that we choose.

Let's go a step further and put some rules on how we add boxes.

・ 戸 ・ ・ ヨ ・ ・ ヨ ・

So far, we've allowed ourselves to put our new box in any outside corner that we choose.

Let's go a step further and put some rules on how we add boxes.

We'll call the resulting process Random Rook.

イロト イボト イヨト イヨト

Rules:

• Start at a spot below and to the right of our diagram.

▲ 同 ▶ → 三 ▶

- ∢ ⊒ →

Rules:

- Start at a spot below and to the right of our diagram.
- Next, walk towards the diagram only taking steps left or up.

Rules:

- Start at a spot below and to the right of our diagram.
- Next, walk towards the diagram only taking steps left or up.
- When we step, we have an equal chance of landing on any square that is directly to the left of or above the current square.

Rules:

- Start at a spot below and to the right of our diagram.
- Next, walk towards the diagram only taking steps left or up.
- When we step, we have an equal chance of landing on any square that is directly to the left of or above the current square.

$ \begin{array}{c ccccccccccccccccccccccccccccccccccc$					$\frac{1}{7}$	
					$\frac{1}{7}$	
1 1 1 1					$\frac{1}{7}$	
$\frac{1}{7}$ $\frac{1}{7}$ $\frac{1}{7}$ $\frac{1}{7}$	$\frac{1}{7}$	$\frac{1}{7}$	$\frac{1}{7}$	$\frac{1}{7}$		

Rules:

- Start at a spot below and to the right of our diagram.
- Next, walk towards the diagram only taking steps left or up.
- When we step, we have an equal chance of landing on any square that is directly to the left of or above the current square.

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

- Say we land on the pink square.
- Now repeat the steps we just did again.
- Keep repeating them until we've reached an outside corner.

Congratulations! We've just turned the partition (3,2) into the partition (4,2) by playing Random Rook!

・ 戸 ・ ・ ヨ ・ ・ ヨ ・

Now let's start with the partition (1) and add squares one at a time by playing Random Rook repeatedly. This is exactly what we did earlier

except now we're not choosing where to add the extra box ourselves – instead, we're following the Rules of Random Rook.

< 回 > < 回 > < 回 >

If we do this for a long time, making a bigger and bigger shape and then turn it so it's resting on its point, like so,

then the ragged edge of the diagram will always make the same approximate shape as the diagram increases in size!

イロト イヨト イヨト

The Limit Shape

Kyla Pohl Partitions and Hook Walk Algorithms

What do I think about?

I ask questions about what happens when we change the rules of Random Rook slightly.

э

What do I think about?

I ask questions about what happens when we change the rules of Random Rook slightly.

For example, what happens when we prefer to go to the left instead of up at each step?

What kinds of shapes do we usually end up building?

Thank you!
